As investments in new power projects are drying up and discoms are unable to ensure reliable power supply, commercial and industrial consumers are increasingly turning to captive power plants (CPPs). CPPs present a viable option for industrial and commercial consumers to meet their energy demand, hedge against the risks of high grid power tariffs and manage energy costs. Further, trading or third-party sale of surplus power can provide additional revenue to CPP owners. Going forward, with the Union Budget proposing the rationalisation of open access charges and undesirable duties on captive generation is expected to give an impetus to the captive power segment. The new report launched by *India Infrastructure Research* will provide a comprehensive analysis of the existing and upcoming captive power plants in India, including a database of more than 2,800 CPPs across various fuels (coal, gas, liquid fuels and renewables). It will also highlight the impact of recent policy developments that will help propel the sector in the next few years. In addition, the report will provide insights into the relevant aspects of the market in the current context such as tariff trends, open access policy and charges, emission standards, grid reliability, and group captives.
